

CIS121

Introduction to Computer Information Systems

Course Syllabus

Instructor: Samuel T. Scott
Office: 402a
Phone: (253) 964-6735
Email: sscott @ pierce.ctc.edu

Pierce College, Lakewood, WA

Computer Ethics and Standards

The willful abuse of Pierce College CIS/CNE/DDSGN computer systems, hardware and/or software, which renders the system(s) inaccessible or unavailable to other students, staff, or faculty and necessitates the repair, replacement, rebuilding, regeneration, or reloading of hardware and/or software may be grounds for an instructor issuing a failing grade for the course.

Willful abuse includes but is not limited to the following examples:

- Implementing passwords for video screen savers.
- Knowingly loading or transmitting viruses by any means to a CIS/CNE/DDSGN computer system.
- Formatting, re-formatting, converting, or partitioning hard drives except under the expressed and explicit direction and supervision of a CIS/CNE/DDSGN faculty/staff member or Pierce College Institutional Technology (IT) staff member.
- Deleting or moving data or information from network drives except at the expressed and explicit direction and supervision of a CIS/CNE/DDSGN faculty/staff member or IT staff member.
- Loading software onto CIS/CNE/DDSGN computer systems except at the expressed and explicit direction and supervision of a CIS/CNE/DDSGN faculty/staff member or Pierce College IT staff member, approved by IT, and properly licensed to Pierce College.
- Using a character string other than “**password**” for the password in CIS/CNE/DDSGN classes where computer security, accounts, permissions, logon procedures, etc., are taught and practiced. No passwords shall be implemented without the explicit direction and supervision of a CIS/CNE/DDSGN faculty/staff member or Pierce College IT staff member. The character string “password” is the only authorized password to be used. Special circumstances during some CIS/CNE/DDSGN courses may require unique passwords which may be used only under the expressed and explicit direction and supervision of a CIS/CNE/DDSGN faculty/staff member.

Unauthorized Activities:

While attending classes conducted in a computer lab, students will not engage in any activity that is not directly related to class instruction, objectives, outcomes, or learning activities during the prescribed class times. Any student engaging in non-class activity will be directed to immediately cease the activity. Failure to immediately cease the unauthorized computer activity may be grounds for the student’s removal from the lab and possible course failure. Examples of unauthorized activities during class include: computer games, email, and web surfing.

CIS121 Diagnostic Assessment

Name: _____

Class Time: _____

1. What is a computer?
2. What is data?
3. What is information?
4. Who invented/developed the internet?
5. How does the internet work?
6. What is the primary objective of information systems?
7. What is the most common input device?
8. What is the most common output device?
9. What is the difference between system software and applications software?
10. What is a MODEM and what does it do?
11. What is the systems development life cycle?
12. Why is a computer dumb?

Memorandum

Date: Today's date

To: Mr. Scott, CIS121 Instructor, Pierce College

From: Your Name, CIS121 Student, Pierce College

Subject: CIS121 Lab Assignment

Paragraph is **Bold**, centered, and 12 pt.

Bold

In this lab assignment we are using Microsoft Word to create, edit, format, and print a word processing document. In the course of this exercise we will see how a word processor handles word wrapping, alignment, special indents for paragraphs, font and paragraph formatting. You only need to press the <Enter> key at the end of a paragraph whether the paragraph is a blank line, a letter, a word, a sentence, or a multiple sentence "paragraph". As you type, try to use good typing practices of two spaces after colons and periods, one space after commas and semicolons, and two spaces between the state abbreviation and zip code in an address.

Paragraphs are double spaced with a ½" first line indent.

Paragraph is single spaced, indented ½" from the left and right margins, and justified.

In order to experiment with editing functions like cut, copy, and paste, you will need to follow the Windows paradigm of "selecting first, then performing your operation". Make sure the insertion point, i.e. the cursor, is where you want text inserted or pasted. You should also practice using the mouse to select a word, series of words, line, paragraph, and entire document by pointing and clicking/double clicking/or dragging as appropriate. **This sentence is bold. You can turn bold on or off by <clicking> on the bold button on the formatting toolbar or pressing <ctrl> + on the keyboard.** *This sentence is in italics. Turning on/off italics works just like bold except the keyboard keystrokes are <ctrl> + <I>.* **This sentence has all three, bold, italics, and underline.**

While the default MS Word template generally establishes Times New Roman as the default font face with a point size of 10 and one inch top/bottom and 1 ¼" left/right margins, you can experiment with changes either by using a dialogue box or the rulers. The procedures you use will become largely a matter of personal preference depending on the view you prefer for your typing.

Note: This is an example of a word processing document that you are required to submit for homework credit.

CIS121 Lab Exercise for Excel

Dailey Hardware Sales

| Item | Qty Sold | Cost | Sale Price | Margin | Gross |
|---------|----------|----------|------------|----------|-----------|
| Hammer | 5 | \$ 3.50 | \$ 7.00 | \$ 3.50 | \$ 17.50 |
| Wrench | 7 | \$ 1.75 | \$ 4.50 | \$ 2.75 | \$ 19.25 |
| Saw | 9 | \$ 4.35 | \$ 12.00 | \$ 7.65 | \$ 68.85 |
| Drill | 11 | \$ 7.25 | \$ 21.00 | \$ 13.75 | \$ 151.25 |
| Grinder | 3 | \$ 21.35 | \$ 49.00 | \$ 27.65 | \$ 82.95 |
| Total | | | | | \$ 339.80 |

Cells A1:F1 merged with contents of A1 centered.

Content of A3:F3 centered in each cell, bolded, and underlined. Cells C4:F8 formatted to currency style.

Autosum function used for F9.

Quantity of Items Sold

Hammer Wrench Saw Drill Grinder

Ranges A4:A8 and B4:B8 used for this 3D pie chart.

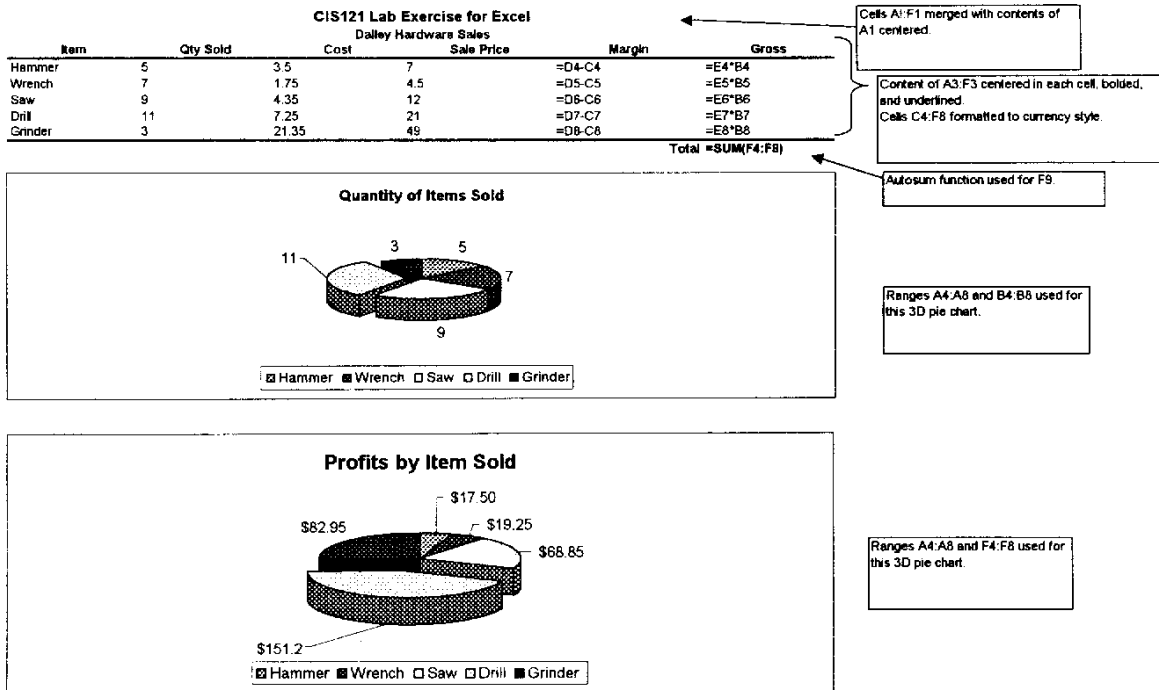

Profits by Item Sold

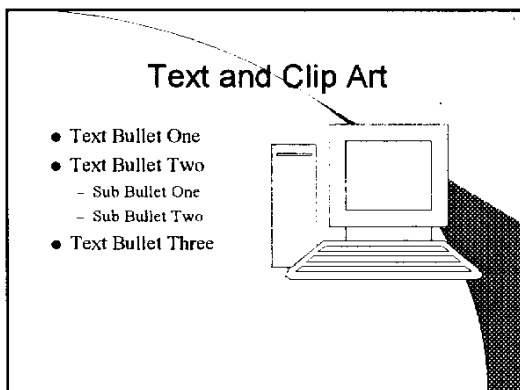

Hammer Wrench Saw Drill Grinder

Ranges A4:A8 and F4:F8 used for this 3D pie chart.

Note: This is an example of a spreadsheet and pie chart you are required to submit for grade. Be sure to use the appropriate formulas to calculate the margin, gross, and total.

Note: This is the formula view of your spreadsheet. To switch to this view, use the keystrokes <Ctrl>+<tilde>. The tilde key is the key to the immediate left of the one/question mark key on the keyboard.

Note: This is an example of six slides created using different layouts you are required to submit for credit.

Addresses

| Address ID | First Name | Last Name | Address | City | State/Province | Postal Code | Country | Email Address |
|------------|------------|---------------|----------------|------------|----------------|-------------|---------|---------------|
| 155 | John | Smith | 123 Main St | Yourtown | VA | 22032- | | |
| 156 | Bill | Jones | 234 Olive St | Lakewood | WA | 98300- | | |
| 157 | Mary | Carter-Smythe | 345 Bay St | Puyallup | WA | 98400- | | |
| 158 | Sue | Shoemaker | 125 Mt. Ranier | Portland | OR | 97500- | | |
| 159 | Tom | Wright | 687 Helens | Fairfax | VA | 22030- | | |
| 160 | Janice | Scott | 9876 Georgia | Rockville | MD | 20900- | | |
| 161 | John | Doe | 123 Maiun St | Tacom | WA | 98300- | | |
| 162 | Bill | Clinton | 1600 Pennsylv | Washington | OR | 98200- | | |

Note This is an example of the Address database table where you will be required to add your data.

| Last Name | First Name | City | State/Province | Postal Code |

QBASIC Reserved (Key) Words

| Reserved (Key) Word | Description/Useage |
|---|---|
| CLS | Clears the screen |
| REM (or abbreviated as a single quote ') | Remark - computer does not execute, used to add notes, etc into source code for explanations, visual separation of different sections, modules, etc. |
| END | Terminates program execution |
| Input/Output | |
| INPUT <i>variablename</i> | Prints a "?" to the screen and waits for keyboard input for the variable |
| INPUT "text"; <i>variablename</i> | Prints the text inside the double quotes to the screen and a "?" and waits for keyboard input of variable. You must separate the "text" and variable name with punctuation, either a ";" or a ",". The semicolon places the "?" in the next position following the text. The period tabs the "?" 5 spaces to the right. |
| PRINT | Prints a blank line to screen |
| PRINT "text" | Prints the text inside the double quotes to the screen |
| PRINT TAB (xx) "text" | Tabs the start of printing "xx" spaces from the left margin of the screen and prints the text inside the double quotes to the screen |
| PRINT USING "\$\$##,###.##"; <i>variablename</i> | Used to format number input to the style indicated between the double quotes, in this case with a \$ sign, comma at thousands, and 2 decimal places. You must separate the "format" and variable name with punctuation, a semicolon so the program will print the value of the variable indicated in the format indicated. |
| LPRINT | Same as PRINT only to a printer |
| LPRINT "text" | Same as PRINT "text" only to a printer |
| LPRINT TAB (xx) "text" | Same as PRINT TAB only to a printer |
| LPRINT USING "\$\$##,###.##"; <i>variablename</i> | Same as PRINT USING only to a printer |
| Loops and Decisions | |
| DO UNTIL <i>variable condition</i> | Starts a loop which executes until the variable condition is true, must use LOOP to return to DO UNTIL program line |
| DO WHILE <i>variable condition</i> | Starts a loop which executes while a variable condition is true, must use LOOP to return to DO WHILE program line |
| LOOP | Returns execution of a series of program lines to the beginning of a DO UNTIL or DO WHILE loop |
| IF <i>variable condition</i> THEN <i>statement</i> ELSE <i>statement</i> | Provides means to branch execution of program, trap errors, make decisions. If the variable condition is <i>true</i> , the <i>then</i> statement is executed, otherwise the <i>else</i> statement is executed. The <i>else</i> may be omitted if you want the program line following the IF-THEN to be executed. If a program line(s) follows the ELSE that is not simply a continuation of program execution but special actions you desire to be executed if the variable condition is false, you must use an END IF to mark the last line that would be executed if the variable condition is false. |
| Variable Types | |
| variablename | Default single precision number (calculated to 8 decimal places) |
| variablename! | Specifies single precision number |
| variablename# | Specifies double precision number (calculated to 16 decimal places) |
| variablename% | Specifies integer, no decimal places |
| variablename\$ | String, i.e. lables or names, a combination of letters and numbers |

Note: variablenames must be continuous characters, no spaces allowed.

CIS121– QBASIC Lab Exercise Scenarios

Project 1: Write a QBASIC program using good structured programming techniques to convert Fahrenheit temperature values to Celsius temperature values. The program must include a loop to repetitively perform the conversion until the user inputs an ending criterion. The formula for conversion is:

$$\text{Tempcel} = (\text{TempF} - 32) / (9/5)$$

Project 2: Write a QBASIC program using good structured programming techniques to calculate the monthly payment on an installment loan. Provide the user with the ability to iteratively change the down payment, interest rate, and term of the loan in months. The interest rate needs to be inputted in decimal form, i.e. 6% = .06. The program must include a loop to repetitively perform the operation until the user inputs an ending criterion.

The formula to calculate the monthly payment is:

$$\text{Mopay} = \text{Amtfin} / ((1 - (1 + \text{Intrate} / 12) ^{-\text{Term}}) / (\text{Intrate} / 12))$$

Example QBASIC Program

Line numbers are shown for reference only. They are NOT required nor are they to be typed when programming in Quick BASIC.

```
Line 1  REM*****
Line 2  REM**** Identification Section ****
Line 3  REM*****
Line 4  REM Programmer:  John Doe
Line 5  REM Date Written:  Feb 1999
Line 6  REM Program Name:  Number Multiplier
Line 7  ' Program Purpose - to create a number calculator
Line 8  ' Program Version:  1.20
Line 9  '*****
Line 10 '**** Data Dictionary ****
Line 11 '*****
Line 12 'Variable Name      Variable Type      Description
Line 13 'firstnum           number (inputted)   first number inputted
Line 14 'secondnum          number (inputted)   second number inputted
Line 15 'calcnun             number (derived)    the answer
Line 16 'yourname$          string (inputted)   user's name
Line 17 'finished$          string (inputted)   exit/program ending condition
Line 18 '*****
Line 19 '**** Procedure Section ****
Line 20 '*****

Line 22 INPUT "Please type in your name and press ENTER.  "; yourname$
Line 23 PRINT
Line 24 PRINT "Hello, "; yourname$; ", I am here to help you with math."
Line 25 PRINT
Line 26 PRINT yourname$; ", you type in the numbers and I will do the work."
Line 27 PRINT "I am programmed to multiply two numbers for you."
Line 28 PRINT
Line 29 DO UNTIL finished$ = "Y" OR finished$ = "y"
Line 30     PRINT
Line 31     INPUT "What is your first number"; firstnum
Line 32     INPUT "What is your second number"; secondnum
Line 33     calcnun = firstnum * secondnum
Line 34     PRINT
Line 35     PRINT "The answer is:  "; calcnun
Line 36     INPUT "Are you finished multiplying (Y or y)"; finished$
Line 37     CLS
Line 38 LOOP
Line 39 PRINT
Line 40 PRINT "I hope I helped, "; yourname$; ", just run me whenever you need me."
Line 41 PRINT "As a computer, I don't get tired doing repetitive or boring things."
```

QBASIC Program Evaluation Rubric

| Attribute | Emerging (5 points) | Competent (8 points) | Exemplary (10 points) |
|------------------------------------|--|--|--|
| Program Properly Documented | Program poorly documented with only minimal identification elements, sparse variable dictionary. | Program partially documented with some identification elements missing and variable dictionary listing all variables but inconsistent on including types and descriptions. | Program fully documented at the beginning using REMARKS to identify the program name, programmer, date, version, short description, complete variable dictionary containing all variable names, variable types, and variable descriptions. |
| Effective Communication | Program provides minimal user interface instructions. | Program provides some user guidance and instruction use PRINT statements to provide guidance and implication of program function. | Program makes extensive use of PRINT statements to create the user interface to inform user in a logical, systematic, clear, and concise manner the program's function and procedures. |
| Iteration | Program provides iterative execution through implementation of a DO loop control structure but exit criteria and/or procedures flawed. | Program provides iterative execution through implementation of a DO loop control structure with clear exit criteria and procedures. | Program provides iterative execution through implementation of at least 2 DO loop control structures, one controlling overall execution and another providing error trapping with clear exit criteria and procedures. |
| Inputs | All required user inputs are prompted with minimal directions to the user. | All required user inputs are prompted with messages to the user controlled by the PRINT keyword followed by the INPUT keyword to capture the variable value. | All required user inputs are prompted with complete and unambiguous messages to the user displayed as literals controlled by the INPUT keywords and captured as variable values. |
| Outputs | All program outputs are minimally described or explained to the user on the screen with PRINT keyword controlled statements with the correct answer. | All program outputs are defined to the user on the screen with PRINT keyword controlled statements with the correct answer. | All program outputs are fully described and explained to the user on the screen with PRINT keyword controlled statements with the correct answer. |

Web Publishing

Before the advent of the World Wide Web, the means to share opinions and ideas with others easily and inexpensively was limited to classroom, work, or social environments. Generating an advertisement or publication required a lot of expense. Today, businesses and individuals can convey information to millions of people by using Web pages.

Web Publishing is the process of developing, maintaining, and posting Web pages. With the proper hardware and software, Web publishing is fairly easy to accomplish. For example, clip galleries offer a variety of images, videos, and sounds.¹ A sound card allows users to incorporate sounds into Web pages. With a microphone, a Web page can include voice. A digital camera provides a means to capture digital photographs. A scanner can convert existing photographs and other graphics into a digital format. A video capture card and a video camera can incorporate videos into Web pages. A video digitizer can capture still images from a video (Thrall and Winters 46-68).

HTML (hypertext markup language) is a set of special codes used to format a file for use as a Web page. These codes, called tags, specify how the text and other elements

¹ Many current software packages include a clip gallery. Clip galleries also are available on the Web or may be purchased on CD-ROM or DVD-ROM (Zack 9-24).

of the Web page display in a Web browser and where the links on the page lead. A Web browser translates the document with the HTML tags into a functional Web page.

Developing, or authoring, a Web page does not require the expertise of a computer programmer. Many word processing and other application software packages include Web page authoring features that assist in the development of basic Web pages. Microsoft Office 2000 products, for example, provide easy-to-use tools that enable users to create Web pages and incorporate items such as bullets, frames, backgrounds, lines, database tables, worksheets, and graphics into the Web pages (*Shelly Cashman Series® Microsoft Word 2000 Project 2*). Web page authoring software packages enable the development of more sophisticated Web pages that might include video, sound, animation, and other special effects. Both new and experienced user can create fascinating Web sites with Web page authoring software.
